Part 105. The following provisions of the standard apply to structures and structural components at the design level: 1. Structures, including foundations, shall be designed for maximum service life in accordance with approved plans, specifications, and construction documents. 2. Structures shall be designed so that all systems and elements are sized and interrelated in such a manner as to meet the fire safety requirements of the building codes. 3. Structures shall be designed to protect against the most destructive type of fire according to the Fire Door and Fire Rated Door requirements of § 105.10 and Table G-10. 4. Structures shall be designed to provide protection against the types of hazards related to blowing and breaking open a door, opening a window, overturning a fuel container, or discharging flammable vapors as specified in § 105.5. 5. Risers shall be designed to support the attached and suspended elements according to the requirements specified in § 105.7. 6. Risers shall be designed to

---

support the attachment of suspended elements at a level determined by the building code as the bottom of the window sill and floor joist. 7. Horizontal elements shall be designed to provide support for all points of attachment for the suspended elements at heights that are determined by the building code as the point below which the supporting structure's top may become overloaded with the weight of the suspended elements. 8. Suspended elements shall be designed so that, when in the loaded condition, horizontal elements provide adequate support for a level span of at least 24 inches above the finished floor. 9. Suspended
